

Trade expertise with human-AI teams.

Earn credits for work in your strongest field. Use them to request help from another specialist team.

THE EXCHANGE

WHY IT DIFFERS

Credits come from approved contributions; they are not sold, cashed out, or freely transferred. Each team uses its own AI account and allowance.

A person reviews each result. There is no crypto payment action per job. Lower friction and savings are hypotheses; legal risk is not claimed to disappear.

CURRENT PROTOTYPE

Public demo: browser localStorage. Local build: Python, SQLite, and an optional Codex/Claude Code skill client. In-product skill testing and a confirmed Solana Devnet transaction are pending.

BUSINESS HYPOTHESIS

A proposed \$10/month Pro plan could offer team selection and priority matching; enterprise networks may follow. Credits themselves would not be sold.

\$10/month x 1,000 members = \$10,000 monthly revenue

Illustration only: not actual sales, profit, or market size. Costs and willingness to pay remain untested. A 10% efficiency gain is also only a hypothesis.

Market signals: OpenAI reported over 5 million weekly active Codex users (June 2026); Anthropic said Claude Code business subscriptions quadrupled from the start of 2026 (February). Neither figure estimates PairWork demand.

SOLANA TODAY - AND LATER

Today: the local app hashes a completion record; a Devnet Memo submission script is included, but no transaction is confirmed. Credits stay in SQLite. A hash cannot prove job quality or both parties' consent.

Later: specialty reputation and credit allocation could use work logs, AI assessments, requester ratings, completion speed, and field experience. Rule versions, audit history, and optional ecosystem credentials remain unbuilt; credentials would not be official licenses.
